The invention relates to an isolated peptide of 100 amino acids or less in size useful for targeting delivery to an organ or tissue, particularly for treating a disease, e.g. cancer, arthritis, diabetes, inflammatory disease, atherosclerosis, autoimmune disease, bacterial infection, viral infection, cardiovascular disease or degenerative disease. The peptide is also useful for inducing apoptosis, particularly to a subject with ischaemia, cancer, arthritis, diabetes, cardiovascular disease.

The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid models acid; (2) a host cell containing the vector; (3) an isolated containing the vector; (3) an isolated polypeptide whose expression is inhibited by the antisense controlled or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding controlleration or the activity of a gene in an operon required for proliferation or the activity of a gene in an operon required for proliferation or that has an activity against a biological pathway required for proliferation, or that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation or the biological pathway in which a proliferation required gene produce in the test compound that inhibits proliferation of an or a gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) prolifing a compound sectivity; (11) a culture comprising strains in which the gene conjourned strains in which the compound that inhibits in which the gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 product is overexpressed or underexpressed; (12) determining the extent to which each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids are useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Claim 25; SEQ ID NO 48817; 1766pp; English.
```

The present invention describes a method for treating obesity or a selective for adipose tissue; (a) obtaining a targeting peptide selective for adipose tissue; (b) attaching the peptide to a therapeutic agent to form a complex; (c) administering the complex to a subject; and dipose targeting peptides not anorectic and antilipaemic activities, and can be used in peptides have anorectic and antilipaemic activities, and can be used in peptides have morectic and antilipaemic activities, and can be used in peptides not gene therapy. The method is used for treating obesity or a lipodystropathy that is related to infection with human immundeficiency virus (HIV). The peptides used in the method can also be used for targeting delivery to an organ or tissue, such as placental delivery. A receptor that binds to a placenta targeting peptide is used to screen compounds for teratogenic activity. ABRS6806 to ABRS6827 and ACC79106 to ACC79111 represent sequences used in the exemplification of the present invention

Sequence 13 AA;

New antisense nucleic acids, useful for identifying proteins or screening

for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.

The peptide is also useful for inducing apoptosis, particularly to a subject with inflammation or macular degeneration. Furthermore, the peptide is useful for diagnosing the disease cited above. Targeting peptides of the invention can also be used to deliver an agent to a foetus, by attaching a peptide to the agent and administering the peptide to a pregnant subject. Sequences ABG60326-ABG60574 represent selective targeting peptides of the invention
drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from MIPO at from part of the printed secures.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Targeting peptide; cancer; arthritis; diabetes; inflammatory disease; atherosclerosis; autoimmune disease; bacterial infection; apoptosis; viral infection; cardiovascular disease; degenerative disease; ischaemia; inflammation; macular degeneration; antiinflammatory; antidiabetic; cardiovascular; immunomodulator; antibacterial; antiviral; cytostatic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Targeting peptides identified by phage display, useful for targeting delivery to an organ or tissue, particularly for treating a disease, e.g. cancer, inflammatory or autoimmune diseases, infections or cardiovascular
                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                     5
                                                                                                                                                                                Length 762;

The adipose targeting peptides have anorectic and antilipaemic activities, and can be used in peptide and gene therapy. The method is used for treating obesity or a lipodystropathy that is related to infection with human immunodeficiency virus (HIV). The peptides used in the method can also be used for targeting delivery to an organ or tissue, such as placental delivery. A receptor that binds to a placenta targeting peptide is used to screen compounds for teratogenic activity. ABRS6806 to ABRS6807 and ACC79106 to ACC7911 represent sequences used in the

Tumour homing molecules and their conjugates - useful for, e g. directing linked moiety to tumour containing angiogenic vasculature.
                                                                                                                                                                                                                                                                                                                                                                             by in vivo panning. The peptide homes to a breat carcinoma. The in vivo panning comprises administering a library of diverse peptides to a subject having a tumour, collecting a sample of the tumour, identifying a peptide that homes to the tumour, collecting a sample of normal tissue corresponding to the tumour, collecting that the peptide that homes to the tumour, and determining that the peptide that homes peptide can be linked to a moiety (e.g. doxorubicin), and used to direct the moiety to a tumour
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Tumour homing peptide; tumour; diagnosis; endothelial cell; breast;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This synthetic peptide is a claimed example of a breast tumour-homing peptide that was identified using a novel method for obtaining molecules that home to a selected organ or tissue. This in vivo panning method typically involves administering a phage display library to a subject, and identifying expressed peptides which home to the desired organ or tissue, e.g. brain, kidney, angiogenic vascular tissue or tumour tissue. The isolated peptides (see AAW13412-52, AAW1181-86) can be used to target e.g. drugs, toxins or labels to the selected organ/tissue (claimed) or to identify and/or isolate target molecules (claimed). The peptides can be directly identified in vivo, as compared to prior art in vitro screening methods, which require further examination to see if they maintain specificity in vivo
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Obtaining compound that homes to selected organ or tissue - by in vivo panning method, specifically to identify brain, kidney, angiogenic vasculature or tumour tissue homing peptide(s).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

                                                                                                                                                                      vasculature, specifically of a tumour and which have anti-tumour, anti-
inflammatory, anti-angiogenic and anti-arthritic activity. Such molecules
are identified by treating a purified NGR receptor with a test compound
and identifying compounds that bind specifically to the NGR receptor. The
peptides of the invention are inhibitors of angiogenesis and can be used
to produce conjugates for delivering agents to angiogenic vasculature,
particularly anticancer drugs or an imaging agent, for diagnosis or
prognosis. These conjugates may be directed to non-tumour angiogenic
ty asculature, e.g. that present in inflammatory, regenerating or wounded
tissue, e.g. for treatment of macular degeneration, diabetic retinopathy
or rheumatoid arthritis. The peptides provide specific targeting to
thmours, especially their supporting vasculature, since the NGR receptor
is exposed to the circulation only in angiogenic vasculature. Precise
targeting should reduce the systemic toxicity of anticancer drugs in the
conjugates. Complete killing of all target cells may not be essential
since partial denudation of endothelium may result in an occlusive
thrombus, and endothelial cells are unlikely to become resistant to
anticancer agents nor to lose the targeting receptor. AAM93622-W93809 and

Where (I) is: (X1) a Fr1-(X2) b, where: F1 = an Fc domain, X1 and X2 = are each independently selected from -(L1)c-P1, -(L1)c-P1-(L2)d-P2, -(L1)d-P2, (L1)c-P1-(L2)d-P2-(L3)e-P3, or -(L1)c-P1, -(L2)d-P2-(L3)e-P3-(L4)f-P4 where P1, P2, P3, and P4 = are each independently sequences of pharmacologically active peptides; L1, L2, L3, and L4 = are each independently linkers, and a, b, c, d, e, and f = are each independently or 1, provided that at least 0 of a and b is 1. The composition can have cytostatic, antiasthmatic, thrombolytic and immunosuppressive activities. DNAs, vectors and host
                                                                                                                                                                                                       Novel composition of matter comprising an Fc domain and pharmacologically active peptides, useful for treating cancer and autoimmune diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      cells from the present invention can be used for producing plarmaceutical compositions. The compositions are useful for treating cancer, asthma, thrombosis, or autoimmune diseases. The use of an Fc domain (rather than a Fab domain) can provide a longer half-life or incorporate functions such as Fc receptor binding, protein A binding, complement fixation, and possibly placental transfer. AAA69443 to AAA69526 and AAB16955 to AAB18003 represent nucleotide and amino acid sequences used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Modified peptide; therapeutic agent; fusion; Fc domain; cancer; autoimmune disease; cytostatic; antiasthmatic; thrombolytic; VEGF; immunosuppressive; EPO; TFO; CTLA4; mimetic; IL-1; TNF; antagonist; MMP; cytotoxic; erythropoietin; thrombopoietin; interleukin 1; cytotoxic T cell lymphocyte antigen 4; tumour necrosis factor; vascular endothelial growth factor; matrix metalloproteinase; asthma; thrombosis; pharmaceutical.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Score 50; DB 3; Length 13;

The present invention relates to homing pro-apoptotic conjugates, comprising of a tumour homing molecule that selectively homes to a mammalian cell type or tissue, linked to an antimicrobial peptide. The homing pro-apoptotic conjugates are selectively internalised by the mammalian cell type or tissue and exhibits high toxicity, especially to angiogenic vasculature. The antimicrobial peptide has low mammalian cell toxicity when not linked to the tumor homing molecule. The conjugates are useful for the treatment of cancer e.g. Kaposi's sarcoma, breast and prostate cancer or melanoma. The present sequence is a homing peptide isolated in the present invention, which can be conjugated to an antimicrobial peptide to make the homing pro-apoptotic conjugates of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AAE06280 standard; peptide; 13 AA.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        셤
                                                                                                                                                                                                                                                                                                     The present invention describes composition of matter (I) comprising an FC domain, pharmacologically active peptides, and linkers. Where (I) is:

(X1)a-F1-(X2)b, where: F1 = an FC domain, X1 and X2 = are each
independently selected from -(II)c-F1, -(II)c-P1-(I2)d-P2, -(IJ)c-P1-
(I2)d-P2-(I3)e-P3, or -(IJ)c-P1-(I2)d-P2-(I3)e-P3-(I4)f-P4 where P1, P2, P3, and P4 = are each independently sequences of pharmacologically active peptides; II, I2, I3, and I4 = are each independently linkers; and a, b, c, d, e, and f = are each independently 0 or 1, provided that at least 1

Cc, d, e, and f = are each independently 0 or 1, provided that at least 1

Cc of a and b is 1. The composition can have cytostatic, antiasthmatic, thrombolytic and immunosuppressive activities. DNAs, vectors and host cells from the present invention can be useful for treating cancer, asthma, thrombosis, or autoimmune diseases. The use of an Fc domain (rather than a Pab domain) can provide a longer half-life or incorporate functions such as Fc receptor binding, protein A binding, complement fixation, and possibly placental transfer. AAA69443 to AAA69526 and AAB16955 to AAB18003 represent uncleotide and annon acid sequences used in the exemplification of the present invention
                                                                                                                      Novel composition of matter comprising an Fc domain and pharmacologically active peptides, useful for treating cancer and autoimmune diseases.
                                                                                                                                                                                                                                         Claim 39; Page 557; 608pp; English.

The patent discloses novel chimeric prostate-homing pro-apoptotic peptide which comprises a prostate-homing peptide linked to an antimicrobial peptide, where the chimeric peptide is selectively internalised by and exhibits high toxicity to prostate tissue and where the antimicrobial peptide has low mammalian cell toxicity when not linked to prostate-homing peptide. The chimeric peptide is used to direct an antimicrobial peptide in vivo to a prostate cancer, to induce selective toxicity in vivo in a prostate cancer, and to treat a patient with prostate cancer. The present sequence is human breast tumour homing peptide. This sequence is useful in the homing of pro-apoptotic conjugates of the invention Novel chimeric prostate-homing pro-apoptotic peptide, used to treat prostate cancer, comprises a prostate-homing peptide linked to an antimicrobial peptide. The invention relates to a composition comprising an integrin/adhesion antagonistic peptide (I) and a vehicle e.g. IgG Fc. The peptides are antagonistic peptide (I) and a vehicle e.g. IgG Fc. The peptides are compound on laminin or saw-scaled viper echistatin and target integrin, selectin or vinculin. Also included are compounds of formula (Ia) and their multimers (X'1) a-P'1-(X'2) b where; F'1 = Fc domain; X'1 and X'2 = (I'1) c-P'1-(I'1) c-P'1-(I'2) d-P'2-(I'3) e-P'3-(I'4) f-P'4; F'1-P'4 = same or different (I); L'1-L'4 = same or different linkers; a-f = 0 or 1, or vector containing the nucleic acid that encodes (Ia), provided at least one of a and b = 1, a nucleic acid that encodes (Ia), or vector, producing a pharmaceutically active compound (B) by covalently linking at least one Fc domain to at least one amino acid sequence of a selected randomized (I) and any of six laminin-related peptides (Ib). The compositions are used prophylactically and therapeutically in the same way as (I), e.g. to inhibit platelet automatodia arthritis) and many different forms of osteoporoass, also for diagnosis. Attaching the vehicle (eppecially forms) to (I) increases the half-life (free (I) are normally degraded contains the composition and containing the vehicle (eppecially contains).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      quickly in vivo). The present sequence is an antagonist peptide of

The present invention describes a vehicle-peptide molecule (I) or its multimers. (I) can have antinflammatory, antitumour, immunosuppressive, cytostatic, antirhenmatic, antiathritic, antidiabetic, ophthalmological, antianaemic, anorectic, antinfertility, hemostatic, dermatological, cantianaemic, anorectic, antinfertility, hemostatic, dermatological and neuroprotective activities. (I) can be used as a therapeutic or prophylactic agent as well as for screening purposes. (I) is useful for diagnosing diseases characterised by dysfunction of their associated protein of interest, for identifying normal or abnormal proteins of interest, for identifying normal or abnormal proteins of interest, as a part of diagnostic kit to detect the presence of their proteins of interest in a biological sample. Additionally, (I) is useful for treating inflammatory and autoimmune diseases, tumour growth, cancer, infertility, and neurological degenerative diseases, (I), comprising compounds are useful for treating disorders characterised by low medic compounds are useful for treating disorders characterised by computed protein for treating conditions that involve an existing megakaryocyte/platelet deficiency or an expected megakaryocyte/platelet deficiency or an expected megakaryocyte/platelet tumour which result in thrombocytopaenia, splastic anaemia, metastatic tumour which result in thrombocytopaenia, splastic lupus erythematosus,

portions or variants thereof. Specifically, it refers to an antibody fragment where a protein has been inserted into, or replaces a portion of, one or more CDR regions, such that each CDR mimetibody comprises at least one portion of a heavy chain or light chain variable region, which itself comprises at least one human framework region and at least one ligand binding region (LBR). The present invention describes human mimetibodies, including modified immunoglobulins and cleavage products that can be useful in gene therapy and the generation of transgenic plants and animals. Furthermore, the CDR mimetibody is useful for preparing compositions for modulating, treating or reducing the symptoms of immune, cardiovascular, infectious, malignant and/ or neurologic diseases, as well as anaemia. Accordingly, they exhibit immunomodulator, cardiant, antimicrobial, cytostatic and neuroprotective activities. This peptide sequence is an integrin binding peptide sequence used to make a mimetibody of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       mimetic; CDR mimetibody; gene therapy; transgenic; immune;

Sequence 19, Application US/08083590A
Patent No. 5786158
Patent No. 5786158ch Proteins And TITLE OF INVENTION: Therapeutic And Diagnostic Methods
TITLE OF INVENTION: And Compositions Based On No. 5786158ch Proteins And TITLE OF INVENTION: Nucleic Acids
NUMBER OF SEQUENCES: 21
CORRESPONDENCE ADDRESS:
ADDRESSEE: Pennie & Edmonds
STRRET: 1155 Avenue of the Americas
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Length 2471;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Score 46; DB 1; Length 247

Patent No. 6083904

GENERAL INFORMATION:

GENERAL INFORMATION:

TITLE OF INVENTION: Therapeutic And Diagnostic Methods

TITLE OF INVENTION: And Compositions Based On No. 6083904ch Proteins And

TITLE OF INVENTION: Nucleic Acids

NUMBER OF SEQUENCES: 21

CORRESPONDENCE ADDRESS: 2

ADDRESSEE: Pennie & Edmonds

STREET: 1155 Avenue of the Americas
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ä

hypothetical protein F42F12.6 - Caenorhabditis elegans
C;Species: Caenorhabditis elegans
C;Species: Caenorhabditis elegans
C;Species: T22100
C;Accession: T22100
S;Alloyd, C.
Submitted to the EMBL Data Library, November 1995
A;Reference number: Z19514
A;Accession: T22100
A;Status: preliminary; translated from GB/EMBL/DDBJ
A;Rolecule rype: DNA
A;Residues: 1-163 - WIA
A;Residues: 1-164 - WIA
A;Residues: 1-165 - WIA

M., Danilevskaya O.N., Hermon P., Helentjaris, C., M. Springer N.M., Danilevskaya O.N., Hermon P., Helentjaris, T.G., Phillips R.L., Kaeppler H.F., Kaeppler S.M.; Tegequence relationships, conserved domains, and expression patterns are homologs of the Polycomb group genes E(z), esc, and E(PC)."; Plant Physiol. 128:1332-1345(2002).

1. FUNCTION: Polycomb group (PGG) protein. PGG proteins act by forming multiprotein complexes, which are required to maintain the transcriptionally repressive state of homeotic genes throughout but to maintain it during later stages of development. They probably act via the methylation of histones, rendering chromatin probably act via the methylation of histones, rendering chromatin heritatibly changed in its expressibility. Its sequence suggests that it may participate in a potential methyltransferase activity of PCG complexes (By similarity).

1. SUBCELLUIAR LOCATION: Nuclear (Probable).

2. IISSUE SPECIFICITY: Widely expressed.

2. SIMILARITY: Belongs to the EZ family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ä
